WHM & Reseller · cPanel

Creating Hosting Packages in WHM

Create WHM packages so you can offer hosting plans from your DanumHost reseller dashboard.

A WHM **package** is the resource template used when you create a cPanel account (disk, bandwidth, addon domains, email, and feature list). Your DanumHost reseller dashboard needs at least one package on the server before you can link a product to it. If the list is empty, create packages in WHM first.

You need WHM, not only cPanel

Package creation is a **WHM** (Web Host Manager) reseller task. A standard cPanel user login cannot add packages. Open WHM from your reseller service (typically port 2087) or the WHM link DanumHost provides.

Create a package

1. Log in to **WHM**.
2. Go to **Packages → Add a Package**.
3. Enter a short package name (for example `bronze` or `starter`). This is the name DanumHost shows in the server-package list.
4. Set disk quota, bandwidth, addon domains, subdomains, email accounts, databases, and other limits you sell.
5. Choose a feature list if your WHM account offers one.
6. Click **Add**. Repeat for each plan you offer.

You can change limits later under **Packages → Edit a Package**. Existing cPanel accounts on that package pick up the new limits when WHM applies them.

Link it in DanumHost

1. Return to the reseller dashboard **Business information** section.
2. On the product row, click **Edit**.
3. Choose the WHM package you just created and save.

If you only have a cPanel user account and no WHM, contact DanumHost support — reseller hosting must include WHM before you can define packages. For the dashboard steps, see Linking a Hosting Product to a Server Package.
