Files · cPanel

FTP Accounts Management

Create FTP users with restricted access to specific directories for file uploads.

FTP accounts let you upload and manage website files using an FTP client such as FileZilla or WinSCP.

Create an FTP account

1. Go to **Files → FTP Accounts**.
2. Enter a login name and select the domain.
3. Choose a strong password or use the password generator.
4. Set the directory the account can access — use `public_html` or a subfolder for limited access.
5. Set a quota if needed and click **Create FTP Account**.

Connect with an FTP client

- **Host:** your domain name or server IP (or `ftp.yourdomain.com`)
- **Port:** 21 for FTP, or 22 for SFTP if enabled on your DanumHost plan
- **Username:** the full FTP username shown in cPanel
- **Password:** the password you set

For better security, prefer SFTP or use the built-in File Manager when possible. Delete unused FTP accounts to reduce attack surface.
