Security · cPanel

IP Blocker

Block specific IP addresses or ranges from accessing your website through cPanel.

The **IP Blocker** tool denies HTTP access from specified IP addresses — useful when you identify malicious traffic, brute-force attempts, or unwanted visitors.

Block an IP address

1. Go to **Security → IP Blocker**.
2. Enter a single IP (for example `203.0.113.50`) or a range using CIDR notation (for example `203.0.113.0/24`).
3. Click **Add**.

Find IPs to block

Review **Metrics → Visitors** or raw access logs to identify repeat offenders. Look for excessive 404 requests, login attempts, or scanner patterns.

Remove a block

Return to IP Blocker, select the entry, and click Remove. Be careful not to block your own IP or shared CDN ranges used by legitimate services.
