Advanced · cPanel

Track DNS

Monitor DNS propagation and record changes for your domains from cPanel.

The **Track DNS** tool in cPanel helps you verify that DNS changes for your domain have propagated across the internet.

Use Track DNS

1. Go to **Advanced → Track DNS** or **Domains → Track DNS**.
2. Enter the domain name you want to check.
3. Select the record type (A, MX, CNAME, etc.) or view a full DNS report.
4. Review results from multiple DNS servers worldwide.

When to use it

- After changing nameservers to DanumHost.
- After updating MX records for email migration.
- After adding A or CNAME records for a new subdomain.

Propagation can take up to 24–48 hours. If some locations show old values, wait and test again before making further changes.
