Your Account · DanumHost Specific

Account Security and Password

Change your client area password and review security settings at /account/security.

Protect your DanumHost account from the **Security** page at `/account/security`.

Change password

1. Go to **Account → Security**.
2. Enter your current password, then your new password twice.
3. Submit the form. Use a strong unique password not shared with other sites.
4. Sign in again on other devices if sessions are invalidated.

Two-factor authentication

If your organisation enables email two-factor login, you will receive a code at each sign-in from `/login`. Keep your login email secure and up to date under Account Details.

Team security

Each team member has their own password. Owners should remove former staff promptly under **User Management** so they cannot sign in.
